

# Sufiyan Mulla

I'm a product-oriented full-stack developer. I am capable of designing, building, and shipping production-grade web applications that solve real user problems. I enjoy learning new tools and turning ideas into working products.

- TypeScript
- Full stack development
- REST APIs
- Node.js
- MongoDB
- React.js
- Express.js
- React Router
- Redux Toolkit
- Mongoose
- TailwindCSS
- Zod
- Postman
- AWS EC2
- Vercel
- Cloudinary
- JWT
- Git
- Shadcn/ui

## Projects

### 1. Aplamart

This is a comprehensive e-commerce application (basically an improved version of my classroom project, RSTStore) featuring production-grade capabilities. The application is well-typed and has strict frontend and backend validation. This application is completely responsive on any device and has some advanced features like media management.

### 2. RST Store

This is a simple ecommerce classroom project in JavaScript + React.js. This application features a simple product listing, product details page, cart, checkout, and admin dashboard and is responsive on any device.

### 3. Canva To PDF

This is a practice project based on Express.js, Socket.io, and Puppeteer.js. This is a backend server with some APIs configured to receive data and send files as binary data. The API route accepts the request with a JSON object as the request body which must include the URL of the canva design and the placeholders with the values of the placeholders, to be replace with.
